**DETAILED ACTION**

***Allowable Subject Matter***

1. The following is an examiner's statement of reason for allowance.

The primary reasons for allowance for claims 1-12 are the inclusion of the limitations of the apparatus for and the method of forming multicolor halftone images including halftone plates of a plurality of colors for reproducing a colored image, wherein each halftone plate is tilted at a specified screen angle and has a relative screen angular difference of 15 degrees or 30 degrees in relation to a next neighboring screen angle. Claims 1 and 7 are the independent claims, and claims 2-6 and 8-12 are the dependent claims to claims 1 and 7, respectively.

Claim 1 is directed to an apparatus for forming multicolor halftone images including halftone plates of a plurality of colors for reproducing a colored image, wherein each halftone plate is tilted at a specified screen angle and has a relative screen angular difference of 15 degrees or 30 degrees in relation to a next neighboring screen angle. Claim limitations, recite, "a basic halftone plate having halftone dots disposed at a predetermined pitch on the basis of a predetermined screen angle; one selected halftone plate that is selected from the halftone plates other than the basic halftone plate, and that has a screen angle difference of 30 degrees or 45 degrees in relation to the basic halftone plate, wherein a right triangle is defined for each of the remaining halftone plates such that its vertical angle is equal to a screen angle difference of 30 degrees or 45 degrees which the selected halftone plate has in relation to the basic

halftone plate, and its two sides forming the vertical angle corresponds to screen angle directions of the two halftone plates, and on the basis of the right triangle, respective halftone dots of the two halftone plates are disposed at a pitch equal to the predetermined pitch along the screen angle directions of the two halftone plates corresponding to the two sides forming the vertical angle, the right triangle having a vertical angle of 30 degrees and a ratio of its three sides  $\sqrt{3}:1:2$  or a vertical angle of 45 degrees and a ratio of its three sides  $1:1:\sqrt{2}$  wherein the halftone dots are disposed on the basis of the ratio of the three sides of the right triangle represented by numerical values including  $\sqrt{3}$  or  $\sqrt{2}$ , which is an irrational number, the numerical values being approximated by integral values which approximate values obtained by multiplying the numerical values by an integer".

Prior art Urabe et al '835 teaches "an apparatus for forming multicolor halftone images including halftone plates of a plurality of colors for reproducing a colored image, wherein each halftone plate is tilted at a specified screen angle and has a relative screen angular difference of 15 degrees or 30 degrees in relation to a next neighboring screen angle, the apparatus comprising: a basic halftone plate having halftone dots disposed at a predetermined pitch on the basis of a predetermined screen angle; and wherein the halftone dots are disposed on the basis of the ratio of the three sides of the right triangle represented by numerical values including  $\sqrt{3}$  or  $\sqrt{2}$ , which is an irrational number, the numerical values being approximated by integral values which approximate values obtained by multiplying the numerical values by an integer".

Urabe does not disclose that "one selected halftone plate that is selected from the halftone plates other than the basic halftone plate, and that has a screen angle difference of 30 degrees or 45 degrees in relation to the basic halftone plate, wherein a right triangle is defined for each of the remaining halftone plates such that its vertical angle is equal to a screen angle difference of 30 degrees or 45 degrees which the selected halftone plate has in relation to the basic halftone plate, and its two sides forming the vertical angle corresponds to screen angle directions of the two halftone plates, and on the basis of the right triangle, respective halftone dots of the two halftone plates are disposed at a pitch equal to the predetermined pitch along the screen angle directions of the two halftone plates corresponding to the two sides forming the vertical angle, the right triangle having a vertical angle of 30 degrees and a ratio of its three sides  $\sqrt{3}:1:2$  or a vertical angle of 45 degrees and a ratio of its three sides  $1:1:\sqrt{2}$ ".

Prior arts, Ikuta '682 teaches "the remaining halftone plates, wherein a right triangle is defined for each of the remaining halftone plates such that its vertical angle is equal to a screen angle difference of 30 degrees or 45 degrees which the halftone plate has in relation to another halftone plate, and its two sides forming the vertical angle corresponds to screen angle directions of the two halftone plates, and on the basis of the right triangle, respective halftone dots of the two halftone plates are disposed at a pitch equal to the predetermined pitch along the screen angle directions of the two halftone plates corresponding to the two sides forming the vertical angle".

However, Urabe et al '835 alone or combining with the prior arts, i.e. Ikuta '682, and Delabastita et al '807, do not teach the claim limitations of Claim 1, "one selected

half-tone plate that is selected from the half-tone plates other than the basic half-tone plate, and that has a screen angle difference of 30 degrees or 45 degrees in relation to the basic half-tone plate, wherein a right triangle is defined for each of the remaining half-tone plates such that its vertical angle is equal to a screen angle difference of 30 degrees or 45 degrees which the selected half-tone plate has in relation to the basic half-tone plate, and its two sides forming the vertical angle corresponds to screen angle directions of the two half-tone plates, and on the basis of the right triangle, respective half-tone dots of the two half-tone plates are disposed at a pitch equal to the predetermined pitch along the screen angle directions of the two half-tone plates corresponding to the two sides forming the vertical angle, the right triangle having a vertical angle of 30 degrees and a ratio of its three sides  $\sqrt{3}:1:2$  or a vertical angle of 45 degrees and a ratio of its three sides  $1:1:\sqrt{2}$ .

In addition, applicant's arguments, pages 8-10, Remarks, 10/23/2009, that the cited prior arts do not teach the claim limitations recited above are persuasive, and the examiner does not find any prior arts teach or suggest the above claim limitations. Thus, the invention appears as a unique and non-obviousness invention.

As stated above, Claim 7 is directed to a method of forming multicolor half-tone images including half-tone plates of a plurality of colors for reproducing a colored image, wherein each half-tone plate is tilted at a specified screen angle and has a relative screen angular difference of 15 degrees or 30 degrees in relation to a next neighboring screen angle which substantially corresponds to operation of the device in claim 1, and with method steps directly corresponding to the function of device elements in claim 1.

Because of these reasons, the independent claims 1 and 7 are allowable. Claims 2-6, and 8-12 are also allowable because of their dependence to claims 1 and 7, respectively.

***Reference Prior Arts***

2. The closest prior arts in the record are Urabe et al (US 5,270,835), Ikuta (US 5,455,682), and Delabastita et al (US 5,766,807).
